SEMI – MICRO QUALITATIVE ANALYSIS OF SIMPLE INORGANIC SALT

Classical qualitative inorganic analysis is a method of analytical chemistry which seeks to find the elemental composition of inorganic compounds. It is mainly focused on detecting ions in an aqueous solution, therefore materials in other forms may need to be brought to this state before using standard methods. The solution is then treated with various reagents to test for reactions characteristic of certain ions, which may cause color change, precipitation and other visible changes. Qualitative

In this case, the precipitating reagents will be cations that form insoluble salts with the dissolved anions. You will perform an analysis to identify chloride (Cl -), iodide (I -), carbonate (CO 3 2-), sulfate (SO 4 2-) and phosphate (PO 4 3-). The flow chart for the separation and identification of these anions is shown in Fig. 2.

Many inorganic compounds are ionic compounds, consisting of cations and anions joined by ionic bonding. Examples of salts (which are ionic compounds) are magnesium chloride MgCl 2, which consists of magnesium cations Mg 2+ and chloride anions Cl -; or sodium oxide Na 2 O, which consists of sodium cations Na + and oxide anions O 2-.
