### Identifying

Meiosis is preceded by an interphase consisting of the G<sub>1</sub>, S, and G<sub>2</sub> phases, which are nearly identical to the phases preceding mitosis. The G<sub>1</sub> phase, which is also called the first gap phase, is the first phase of the interphase and is focused on cell growth.

Reproduction and  
Meiosis ANSWER KEY.

During meiosis, homologous chromosomes separate, and the haploid cells that form have only one chromosome from each pair. Two cell divisions occur during meiosis, and a total of four haploid cells are produced.

### Identifying

Meiosis is the process by which gametes (sex cells) are generated in organisms that reproduce sexually.

Gametes are produced in male and female gonads and contain one-half the number of chromosomes as the original cell. New gene combinations are introduced in a population through the genetic recombination that occurs during meiosis. Thus, unlike

is characteristic of organisms that reproduce sexually. Such species have in the nucleus of each cell a diploid (double) set of chromosomes, consisting of two haploid sets (one inherited from each parent). These haploid sets are homologous—i.e., they contain the same kinds of genes, but not necessarily in the same form.
