Physical properties of material are those which can be observed without change of identity of material. Physical properties of metals are density, color, size and shape, specific gravity of material, porosity etc. Some of these are defined as below. We should have knowledge of physical properties of materials. Density of Materials. Density is one of most fundamental physical properties of any material. Density of material is defined as mass per unit volume.

Physical Properties of Metals include shiny luster, greyish - silver colour, good heat and electricity conductivity, high melting and boiling points, Some of metals - sodium and calcium (very soft), gold and copper (yellowish colour), and mercury (low melting and boiling points).

PROPERTIES OF ENGINEERING MATERIALS

The general properties of matter such as color, density, hardness, are examples of physical properties. Properties that describe how a substance changes into a completely different substance are called chemical properties. Flammability and corrosion/oxidation resistance are examples of chemical properties.

A material's property (or material property) is an intensive property of some material, i.e. a physical property that does not depend on the amount of the material. These quantitative properties may be used as a metric by which the benefits of one material versus another can be compared, thereby aiding in materials selection.
