Water filtration is the most common method of purification that is used in most homes. Water filtration systems come in many sizes and shapes, and are popular mainly due to their ease of use. Filtration systems use multi level of purification methods. The first level would be a sedimentation filter of typically 0.2 micron pore size.

chemistry - Wikipedia

Affinity chromatography is a very useful technique for "polishing", or completing the protein purification process. Beads in the chromatography column are cross-linked to ligands that bind specifically to the target protein. The protein is then removed from the column by rinsing with a solution containing free ligands.
