A Bingham plastic is a viscoplastic material that behaves as a rigid body at low stresses but flows as a viscous fluid at high stress. It is named after Eugene C. Bingham who proposed its mathematical form.. It is used as a common mathematical model of mud flow in drilling engineering, and in the handling of slurries.A common example is toothpaste, which will not be extruded until a certain ...

There are many "models" for slip (or holdup) in the literature. Hughmark (1962) slip correlation Either horizontal or vertical flow: where $0.95 \frac{GL}{GL + K} \frac{1}{x} \frac{1}{x} !! For a Newtonian fluid wall, shear stress (τ_w) can be related to shear rate by $\tau_w = \mu \dot{\gamma}_w$, where μ is the dynamic viscosity of the fluid. For non-Newtonian fluids, there are different constitutive laws depending on the fluid, which relates the stress tensor to the shear rate tensor.

The advances made by Hooper were taken a step further by Ron Darby in 1999 when he introduced his three-K method. This is the method used in the AioFlo pipe sizing calculator. The three-K equation is slightly more complicated than Hooper's two-K but is able to fit the available data slightly better. This equation is:
